**Abstract**—The purpose of this study was to determine the effect of a 10-week training program on the heart rate (HR) and heart rate reserve (HRR) of sedentary middle-aged men. The subjects were 15 men, 40 to 50 years of age, who had been sedentary for at least 10 years. They were randomly assigned to a 10-week training program or a control group. The training program consisted of 30 minutes of aerobic exercise, 3 times per week, at 70% of the maximum HR. The control group was instructed to maintain their current level of activity. The HR and HRR were measured at rest and during a 10-minute submaximal exercise test at the beginning and at the end of the 10-week period. The results showed that the training program had a significant effect on the HR and HRR of the subjects. The HR at rest decreased from 72 to 68 beats per minute, and the HRR at rest decreased from 28 to 24 beats per minute. The HR during exercise decreased from 155 to 145 beats per minute, and the HRR during exercise decreased from 83 to 77 beats per minute. The results suggest that a 10-week training program can improve the cardiovascular fitness of sedentary middle-aged men.
